

TNBC-0029 Issue 1 Sept 08

Technical Bulletin

| Product : Azur 840C and 740C CD players | Page 1 of 1 |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| | |
| Fault Symptom: | |
| Low gain or no audio output on one or both channels. C270 on the 840C, c740C DAC PCB may be visibly damaged (top pushed up). Relays RL1, 2, 3 close. | |
| Cause: | |
| The unregulated 10V supply on these DAC boards is smoothed by a 470uF rated at 16V. High mains spikes and supply fluctuations can cause prematuthe capacitor. | |
| Solution: | |
| Replace this capacitor with the same value, but rated at 35V. | |
| We advise that you make this modification to all service returns. | |
| n.b. Production from September 2008 will be revised. | |
| | |
