INTRODUCTION

This service manual was prepared for use by Authorized Warranty Stations and contains service information for Marantz Model 4415 Quadradial 4 Receiver.

Servicing information and voltage data included in this manual are intended for use by the knowledgeable and experienced technician only. All instruction should be read carefully. No attempt should be made to proceed without a good understanding of the operation in the receiver.

The parts list furnish information by which replacement part may be ordered from the Marantz Company. A simple description is included for parts which can be usually be obtained through local suppliers.

1. SERVICE NOTES

As can be seen from the circuit diagram, the chassis of Model 4415 consists of following units. Each unit mounted on a printed circuit board is described within the square enclosed by a bold dotted line on the circuit diagram.

- | | |
|---|-----------------------------|
| 1. FM and AM Tuner | mounted on P.C. Board, P100 |
| 2. Phono Amplifier | mounted on P.C. Board, P300 |
| 3. Tone Amplifier | mounted on P.C. Board, P400 |
| 4. Vari-Matrix Unit | mounted on P.C. Board, P500 |
| 5. Power Amplifier | mounted on P.C. Board, P600 |
| 6. Loudness and Speaker Switch Unit | mounted on P.C. Board, P700 |
| 7. Tone Control Unit | mounted on P.C. Board, P750 |
| 8. Power Supply | mounted on P.C. Board, P800 |
| 9. Balance Control Unit | mounted on P.C. Board, P900 |
| 10. Hi Filter Unit | mounted on P.C. Board, P950 |
| 11. Indicator Lamps | mounted on P.C. Board, P980 |

2. AM TUNER

All components except ferrite bar antenna are mounted on a printed circuit board P100.

The AM signals induced in a ferrite bar antenna are applied to the base of converter transistor H113 through a capacitor of C171, while the local oscillator voltage is injected to the emitter of H113 through a capacitor C172. Both AM signals and oscillating voltage are mixed at the base-emitter junction and converted into 455KHz intermediate frequency. The resulting IF signal is applied to the first IF transformer L116 consisting of one ceramic filter and two tuned circuits.

The output of L116 is led to the transistor H104 which in turn apply its output to the transistor of next stage H105. The fully amplified IF output is then applied to the diode H123 to detect audible signal through the detector transformer L117. The detected audio signal is filtered and the final audio output is obtained from pin terminal J118 and applied to the audio amplifier section through the selector switch.

The DC component of the detected IF signal is used as a AGC voltage to control emitter current of H104 through the resistor R185. A part of IF signal output is also applied to the diode H124 through a capacitor C180 and rectified to obtain DC current for energizing the signal strength meter M009.

1.1 Suggestions for AM Tuner Trouble Shooting

Check for broken AM bar antenna, next try to tune station by rotating fly-wheel tuning knob slowly and observe the signal strength meter whether it deflects or not. If the signal strength meter gives a deflection at several frequencies received, no failure may exist in the stages at least preceding final IF transformer L117. Next connect a oscilloscope to the pin terminal J118 and check for audio signals with the tuning meter deflected. If the signal strength meter does not deflect, check the local oscillator circuit. Normal oscillating voltage at the hot end of the

oscillator tuning capacitor is about 2 or 3 volts, varying with tuning capacitor position. When measuring oscillating voltage use a RF VTVM, no circuit tester gives correct indication. If the local oscillator voltage is normal, check all voltage distribution in the AM circuits by using a DC VTVM and compare the measured values with those given in the schematic diagram.

3. FM TUNER

All components are mounted on a printed circuit board P100.

FM signals induced by a FM antenna are led to FM antenna coil L101.

These signals are then applied to the FET RF amplifier which in turn applies its output to the next transistor mixer H102 through a high Q tuned circuit.

The mixer convert its input signal into 10.7MHz intermediate frequency and amplifies it at the same time. The H103 is a local oscillator and its output is injected into the base of mixer transistor, the injection voltage is about 40mV.

The 10.7 MHz front end output is led to the next IF section. The IF section consists of five stage of IF amplifier and one stage of sub IF amplifier. Two pieces of ceramic filters are also used to obtain high selectivity, a pair of symmetrical diode limiters are also employed for the best limiting characteristics, improved capture ratio and good AM suppression. A part of IF amplifier H105 output is rectified by the diode H115, H116 and its DC output is fed back to the gate of FET RF amplifier to decrease the gain with increased signal strength.

3.1 Muting and Auto-Stereo Switching Circuits

The muting circuit consisting of all solid-state electrical switching has been incorporated in the Model 4415.

The DC voltage obtained by rectifying the sub IF output signal from the H109 is applied to the base of H110 and turns on it, if the sub IF output is greater than predetermined level (muting threshold level).

When H110 turns on, the muting switch transistor H111 is turned on, thus decreasing the emitter collector resistance to near zero ohm and allowing emitter current path to the final IF amplifier H108.

When the input signal is lower than the predetermined level, the DC output obtained is small and can not turn on the H110, thus the H110 keeps its turn off state and this makes the switch transistor keep H111 turn off, then no emitter current is supplied to the H108 and signals below the threshold level are muted out.

The muting threshold level can be varied by adjusting the trimming resistor R153.

The DC voltage obtained is also used to make the Auto-Stereo switching transistor H112 turn on and off, and used to energizing the signal strength meter M009.

3.2 MPX Stereo Decoding Circuit

A Non-equalized audio signal from the FM detector is applied through the phase adjuster network of C148 and R161 to input terminal pin ① on the MPX decoder IC H114. The MPX decoder IC consists of a stereo decoder and postamplifier for the output. The right and left channel signals decoded by the stereo decoder H114, appear at pin ⑩ (right channel) and pin ⑪ (left channel), respectively. These signals are passed through the low-pass filters and de-emphasis networks to eliminate undesirable residual switching signals and are then delivered to postamplifier input pin ⑤ (right channel) and pin ⑦ (left channel), respectively. The signals amplified in the postamplifiers to the required level (approximately 10dB) are delivered to pin ⑥ (right channel) and pin ⑧ (left channel), and are then passed through C169 and C168 to pin terminals J114 and J115, hence, through the selector switch to the audio amplifier section. Pin ⑮ on the MPX IC H114 is connected through R163 to the collector of the autostereo switch transistor H112, which turns on or off according to the incoming FM signal strength, thereby automatically switching between the stereophonic and monaural operations. The H112 turns on or off in accordance with whether the FM signal strength is more or less than approximately 25μV.

3.3 Suggestion for Trouble Shooting of FM Tuner

3.3.1 Symptom: No FM Reception

First turn on the power switch and try to tune FM stations. Rotate the fly-wheel tuning knob slowly and observe the FM signal strength meter. If the signal strength meter deflect at several frequencies received, the tuner circuits preceding the discriminator circuit may have no failure. When no reading is obtained in the meter, check FM local oscillator circuit, using a RF VTVM. The normal local oscillator voltage is one or two volts (rms) at the tuning capacitor, depending on the tuning capacitor position. If the local oscillator voltage is normal, next check all voltage distribution in the FM Front End and IF amplifier unit and compare them with those shown in the circuit diagram. When signal strength meter deflects but no sound is obtained, check audio circuits, using high sensitive oscilloscope.

3.3.2 Symptom: No Stereo Separation

Connect a FM RF signal generator output modulated by a stereo modulator to the rear FM ANTENNA terminals, and check the stereo beacon is turned on or not. If not turned on, check for 19 KHz pilot signal and 38 KHz switching signal, using an oscilloscope.

4. PHONO AND PRE-AMPLIFIER

Signals from the PHONO jacks are applied to the phono-amplifier mounted on P300. The amplified and RIAA equalized phono signals and signals from the tuner section and the TAPE/AUX jacks are applied to the selector switch which, in turn, leads the selected signals to the TAPE MON switch and TAPE OUT jacks. Applied to the other section of the TAPE MON switch are signals from the TAPE IN jacks. The TAPE MON switch selects the signals from the selector switch or those from the TAPE IN jacks and the selected signals go to the mode switch. Signals are then mode processed by the mode switch and its associated circuit and applied to the tone control amplifier through the volume control. The bass and treble controlled signals from the tone control amplifier pass through the balance control section and the hi filter before they reach the main amplifier.

4.1 Mode Switch

Mode switch S002 has positions of MONO, 2 CH, DISCRETE, VARI-MATRIX, and SQ DECODER.

In the MONO position, all input signals are mixed together and delivered to all four channels.

In the 2 CH position, each pair of input signals right-front (RF) and right-rear (RR), and left-front (LF) and left-rear (LR) are mixed together. The resultant signals (RF + RR) and (LF + LR) are delivered to the pairs of RF and RR, and LF and LR channels, respectively.

In the DISCRETE position, each channel signal is separately routed to the corresponding channel.

In the VARI-MATRIX position, 2-channel stereo input signals are converted into quadraphonic signals through the vari-matrix circuit; the input right and left channel signals are fed directly to the LF and RF channels, while the signals to the LR and RR channels are synthesized from the 2-channel input signals under the control of the dimension control. The LR and RR channel signal components are controlled by the dimension control as shown below.

Dimension Control Setting	LR Output	RR Output
Minimum (FCCW)	LF + RF	RF + LF
Center	LF	RF
Maximum (FCW)	LF - RF	RF - LF

When the dimension control is set to the minimum position the LR and RR channel signals become monophonic, to the center are stereophonic, and to the maximum are out of phase, thus

providing vanished sound image positioning.

In the SQ DECODER position, signal sources encoded by the CBS SQ system are ideally decoded into 4-channel signals. Required for this operation is incorporation of the SQ Adaptor, Model SQA-1, into the Model 4415.

4.2 Balance Control

Signals from the tone control amplifiers are fed into the balance control circuit, in which the signals are controlled by three balancers: FRONT L-R, REAR L-R, and FRONT-REAR. By setting the FRONT-REAR balancer to the "FRONT" side and the FRONT L-R balancer to the "L" side, for example, only the front left channel is driven.

The balance control circuit is provided with the remote control switch which makes the Model RC-4 Remote Control Box operative when set to the "REMOTE" position. In the "REMOTE" position the balancers on the Model 4415 become ineffective since signals are led to the Model RC-4. The volume level can be adjusted by the volume control either on the Model 4415 or Model RC-4. However, the maximum volume level available by adjustment of the Model RC-4 is determined by the volume control on the Model 4415.

Balance controlled signals are led through the hi filter to the main amplifier section for further power amplification.

5. MAIN AMPLIFIER

Transistor H601 is the pre-driver coupled to the transistor H603 through capacitor C609. The transistor H603 drives the inverter transistors H609 and H611 which, in turn, drive the power stage consisting of H001 and H002. Transistors H605 and H607 are current limiter operating as a power transistor protection circuit.

Excessive current flow in the power output stage is detected by the resistors R645 and R651 and the resultant variation is applied to the transistors H605 and H607 and make them turned on. This decreases the base biasing current for H609 and H611. In this way the current flow in the power output stage (H001 and H002) is restricted within a safe predetermined value.

6. POWER SUPPLY UNIT

The power supply unit consisting of transistors H801 and H802, which operates as an automatic voltage regulator provides +35V DC to all of the amplifiers except main amplifiers and +14V DC to the tuner section.

7. AUDIO TROUBLE ANALYSIS

- | | |
|--------------------------------------|--|
| 1. Excessive line consumption | a. Check for shorted rectifiers H013. |
| | b. Check for shorted transistors H001 through H008.
Check L001 for short. |
| 2. No line consumption or zero bias. | a. Check line cord, fuse, shorted H009 through H012,
H713 & H714. |
| | b. Check for open rectifiers H013, or open L001. |
| 3. Excessive hum and noise level | a. Check filter capacitors C005, C605, & C606. |
| | b. Check for shorted transistor H802. |
| 4. Parastic oscillation | a. Check for defective capacitors, C607, C608, C611,
C612, C625 & C626. |
| 5. Improper clipping | a. Check for proper adjustment of R617 & R618. |

8. TEST EQUIPMENT REQUIRED FOR SERVICING

Table 1 lists the test equipment required for servicing the Model 4415 Receiver.

Item	Manufacturer and Model No.	Use
AM Signal Generator		Signal source for AM alignment.
Test Loop		Used with AM Signal generator.
FM Signal Generator	Less than 0.3% distortion	Signal source for FM alignment.
Stereo Modulator	Less than 0.3% distortion	Stereo separation alignment and trouble shooting.
Audio Oscillator	Weston Model CVO-100P, less than 0.02% residual distortion is required.	Sinewave and squarewave signal source.
Oscilloscope	High sensitivity with DC horizontal and vertical amplifiers.	Waveform analysis and trouble shooting and ASO alignment.
VTVM	With AC, DC, RF range	Voltage measurements.
Circuit Tester		Trouble shooting.
AC Wattmeter	Simpson, Model 390	Monitors primary power to Amplifier.
AC Ammeter	Commercial Grade (1-10A)	Monitors amplifier output under short circuit condition.
Line Voltmeter	Commercial Grade (0-150VAC)	Monitors potential of primary power to amplifier.
Variable Autotransformer (0-140VAC, 10 amps)	Powerstat, Model 116B	Adjusts level of primary power to amplifier.
Shorting Plug	Use phono plug with 600 ohm across center pin and shell.	Shorts amplifier input to eliminate noise pickup.
Output Load (8 ohms, 0.5% 100W)	Commercial Grade	Provides 8-ohm load for amplifier output termination.
Output Load (4 ohms, 0.5% 100W)	Commercial Grade	Provides 4-ohm load for amplifier output termination.

Table 1 Test Equipment Required for Servicing

9. AM ALIGNMENT PROCEDURE

9.1 AM IF Alignment

1. Connect a sweep generator to the test point (A) or J107 and an alignment scope to the test point (B).
2. Rotate each core of IF transformer L116 and L117 for maximum height and flat top symmetrical response.

9.2 AM Frequency Range and Tracking Alignment

1. Set AM signal generator to 525 KHz. Turn the tuning capacitor fully closed (place the tuning pointer at the low end.) and adjust the oscillator coil L115 for maximum audio output.

2. Set the signal generator to 1650 KHz. Place the tuning pointer in the high frequency end and adjust the oscillator trimmer on the oscillator tuning capacitor (CA-2) for maximum audio output.
3. Repeat the step 1 and 2 until no further adjustment is necessary.
4. Set the generator to 600 KHz and tune the receiver to the same frequency and adjust a slug core of AM ferrite rod antenna for maximum output.
5. Set the generator to 1400 KHz and tune the receiver to the same frequency and adjust the trimming capacitors of antenna (CA-1) for maximum output.
6. Repeat the step 4 and 5 until no further adjustment is necessary.

Note: During tracking alignment reduce the signal generator output as necessary to avoid AGC action.

10. FM ALIGNMENT PROCEDURE

1. Connect a FM signal generator to the FM ANTENNA terminals and a oscilloscope and an audio distortion analyzer to the TAPE OUT jacks on the rear panel.
2. Set the FM SG to 87.5 MHz and provide about 3 to 5 μ V. Place the tuning pointer at the low frequency end by rotating the tuning knob and adjust the core of oscillator coil L103 to obtain maximum audio output.
3. Set the FM SG to 108.5 MHz and provide about 3 to 5 μ V output. Rotate the tuning knob and place the tuning pointer at the high frequency end and adjust the trimming capacitor C187 for maximum output.
4. Repeat the step 2 and 3 until no further adjustment is necessary.
5. Set the FM SG to 90 MHz and tune the receiver to the same frequency. Decrease signal generator output until the audio output level decreases with the decreasing generator output. Adjust the antenna coil L101, RF coil L102 and IF transformer L105 for minimum audio distortion.
6. Set the FM SG to 106 MHz and tune the receiver to the same frequency. Adjust the trimming capacitor CF-1, CF-2 for minimum distortion.
7. Repeat the step 5 and 6 until no further adjustment is necessary.
8. Connect a DC VTVM with 1 volt range selected to the test point ⑤ (J120) and adjust the secondary core (upper) of discriminator transformer L107 so that no voltage reading is obtained on the VTVM at no signal.
Next set the FM SG to 98 MHz and increase the output level to 1 K μ V, then tune the receiver to the same frequency so that no deflection is obtained on the VTVM.
Adjust primary core (bottom) of L107 for minimum distortion, and adjust the L108 for the maximum deflection of FM signal strength meter M009.

10.1 Stereo Separation Alignment

1. Set the FM SG to provide 1 K μ V at 98 MHz.
Tune the receiver to the same frequency perfectly (so that the VTVM connected to the test point ⑤ gives no reading).
2. Modulate the FM SG with stereo composite signal consisting of subchannel signal only (of course a pilot signal must be included).
Adjust the core of L110 for maximum audio output, then, modulate the FM SG with a stereo composite signal consisting of L or R channel only, and adjust the trimming resistor R 161 for maximum and equal separation in both channels.

10.2 Muting Circuit Alignment

1. Set the FM SG output to provide 25 μ V (IHF) at 98 MHz and tune the receiver to the same frequency.
Adjust the trimming resistor R153 for the threshold level of 25 μ V (during this adjustment turn the MUTING pushswitch "on").

11. AUDIO ADJUSTMENT

1. Connect a VTVM to J614 (+) and J620 (–) and adjust the trimming resistor R629 until the VTVM reads 10mV DC. For the other channel connect the VTVM to J615 (+) and J621 (–) and adjust the R630 for the same reading.
2. Connect an oscilloscope across the SPEAKER terminals. Apply an audio signal of 1 KHz to the AUX jacks and increase the audio signal until the audio output on the scope begins to start clipping. Adjust the trimming resistor R617 for equal and symmetrical clipping. For the other channel adjust the R618.

12. AUTOMATIC VOLTAGE REGULATOR ADJUSTMENT

Connect a VTVM to J801 (+) and J808 (–) and adjust R801 until the VTVM reads 35.0V under no signal condition.

TECHNICAL SPECIFICATIONS

FM SECTION

Tuning Frequency Range	88 — 108 MHz
IHF M Usable Sensitivity	3.0 μ V
IHF Selectivity	50 dB
Capture Ratio	2.5 dB
Image Rejection Ratio at 106 MHz	50 dB
Signal to Noise Ratio (Mono)	65 dB
Signal to Noise Ratio (Stereo)	55 dB
Total Harmonic Distortion (Mono)	0.2%
Total Harmonic Distortion (Stereo)	0.5%
Frequency Response (ref. 75 μ sec. de-emphasis)	50 Hz — 15 KHz $\pm$ 1 dB
Stereo Separation at 1 KHz	40 dB
Quadradial Output (400 Hz 75 KHz dev.)	300 mV

AM SECTION

Tuning Frequency Range	540 — 1605 KHz
Usable Sensitivity	20 μ V
Selectivity	20 dB
Image Rejection Ratio at 1400 KHz	40 dB
Signal to Noise Ratio	43 dB
Frequency Response (—3 dB)	50 Hz — 4 KHz
Total Harmonic Distortion	1%

AUDIO SECTION

Input Impedance — Low level input	Phono 47K ohm
— High level input	100K ohm
Input Sensitivity — Phono	2.0 mV for 15W output
— High level	150 mV for 15W output
Frequency Response	$\pm$ 2.0dB, 30Hz to 20KHz at 1W output
Intermodulation Distortion	Less than 1.0% at rated power output from 40Hz to 16KHz with all channels driven (S.M.P.T.E.)
Total Harmonic Distortion	Less than 1.0% at rated power output 40Hz to 16KHz with all channel driven
Damping Factor	Greater than 45 into 8 ohms load
Total Noise — From magnetic phono input	Less than 3 μ V equivalent input at rated
to power amp output	output into 8 ohms load
Volume Tracking	Within 3dB
Rated Continuous (RMS) Output per channel, all channels operating simultaneously	15W at 4 and 8 ohms 7.5W at 16 ohms
Comparable Total Music Power	90W at 8 ohms

GENERAL

Power Requirements	120V AC 50 to 60 Hz
Power Consumption — at rated power output, all channels	230 watts

— idling (no signal)	20 watts
Dimensions — Panel Width	17-21/64 Inches
— Panel Height	5-25/64 Inches
— Depth	14-3/8 Inches
Weight — Unit alone	26.5 lbs
— Packed for Shipment	37.5 lbs
